Innovating our mobility  
L-category vehicles: smaller, lighter, more specialised

# Commuting by motorcycle impact analysis

a study of Transport & Mobility Leuven for FEBIAC

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Commuting by motorcycle

#### 1. Impact modal shift on traffic congestion

- Case study Leuven-Brussels
- Global impact on Belgian highway network

#### 2. Impact modal shift on traffic emissions

- Emissions motorcycles vs. passenger cars
- Case study Leuven-Brussels

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Impact on traffic congestion

#### Case study Leuven-Brussels

- 1) Reference scenario: current morning peak (2011)
- 2) Scenario 10% modal shift from car to motorcycle

# Innovating our mobility L-category vehicles: smaller, lighter, more specialised

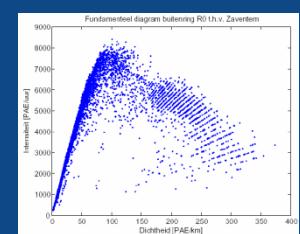

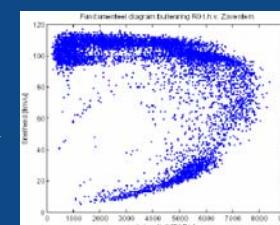

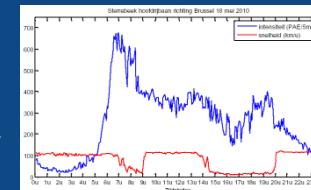

## Reference scenario (morning peak 2011)

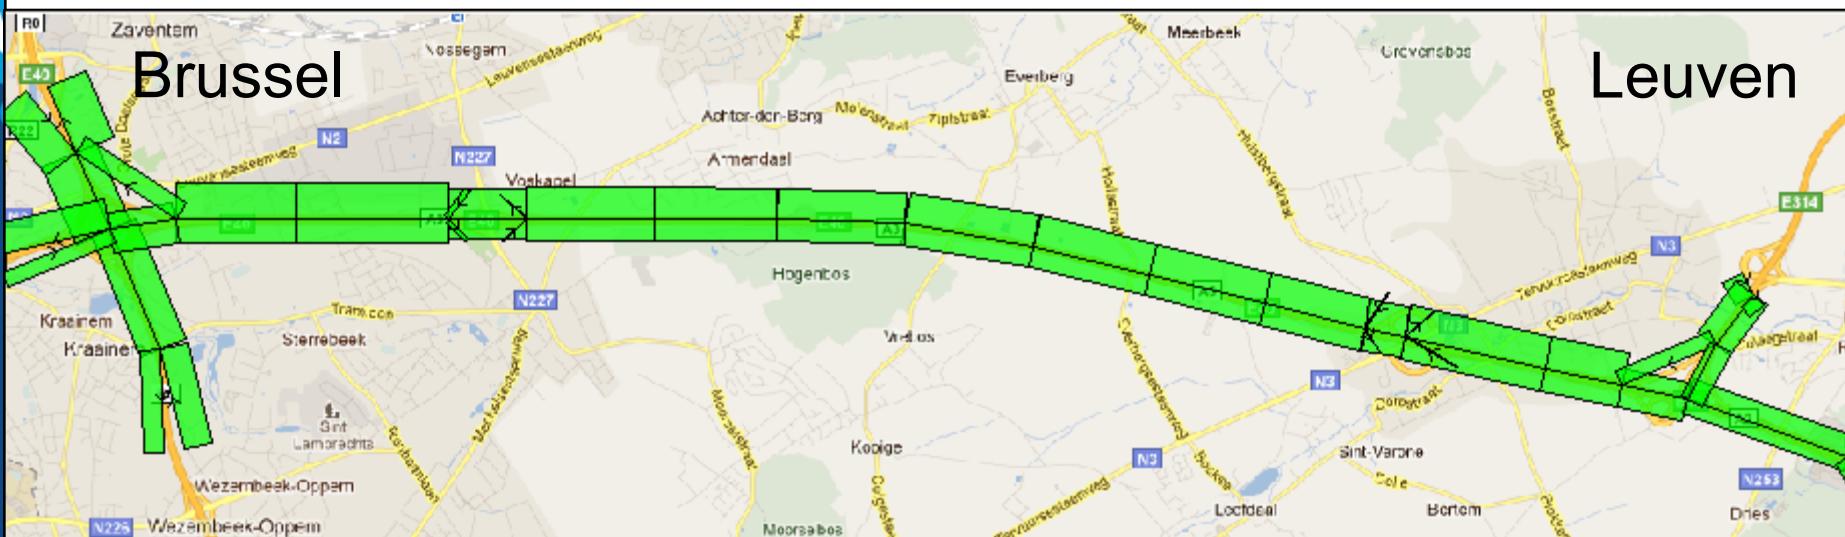

- Dynamic simulation of traffic flows by LTM

- Realistic representation  
in line with traffic counts

- 42 detectors on 7 locations
- May 2011, every 5 minutes:  
volumes, speeds, composition
- Capacity network sections

## Reference scenario - simulation results (6.30 – 9.30)

Free-Flow

Capacity

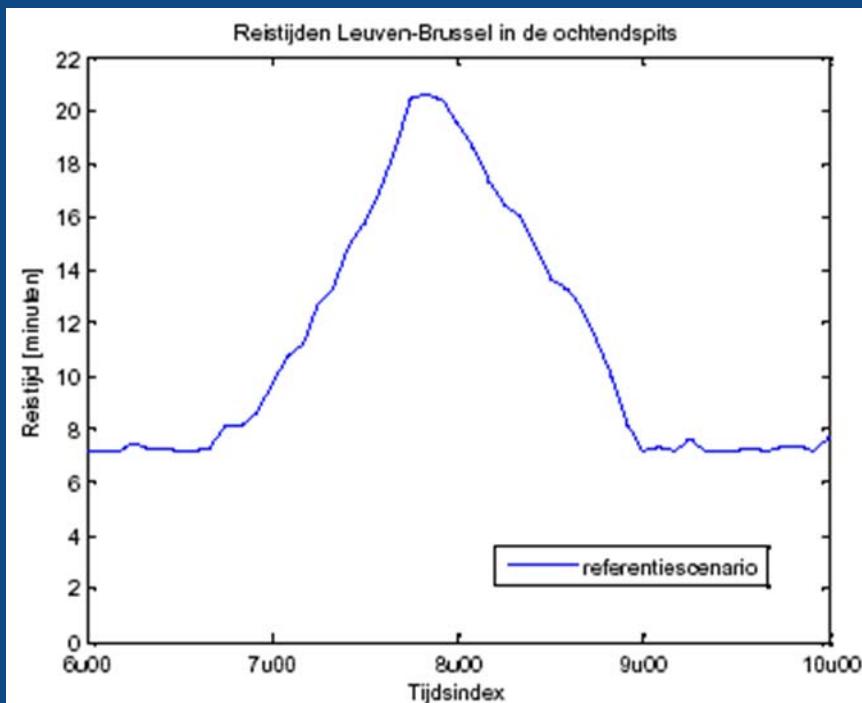

Congestion

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Reference scenario (morning peak 2011)

#### Travel Times

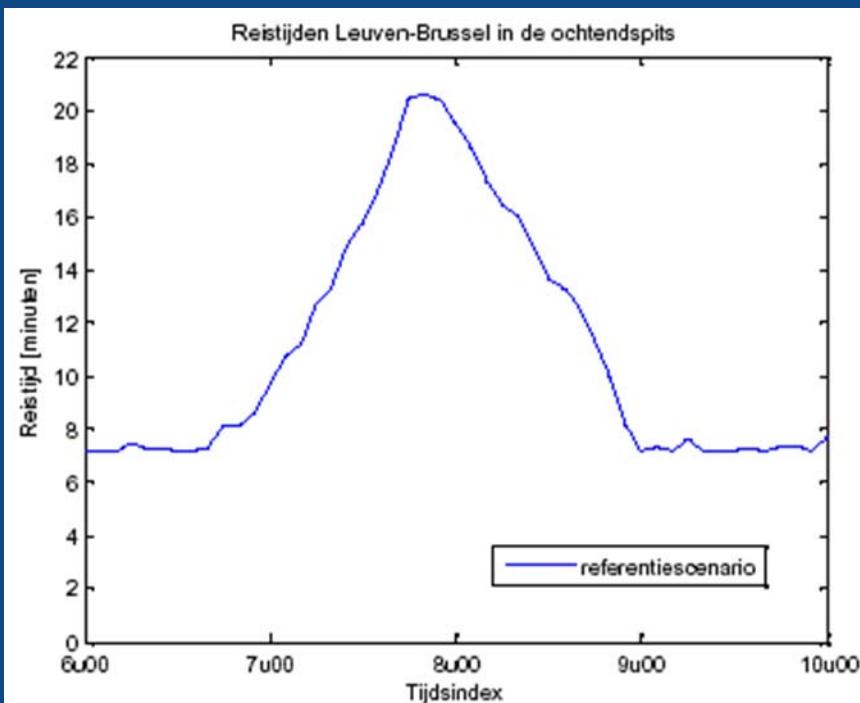

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Reference scenario (morning peak 2011)

#### Travel Times

Total time loss  
(all vehicles Leuven-  
Brussels 6.30 – 9.30)  
**= 1925 hours**

### Modal shift scenario (morning peak 2011)

#### Assumptions:

- 10% passenger cars replaced by motorcycles
- Occupancy passenger car (commute) = 1.1
- Occupancy motorcycle (commute) = 1.0

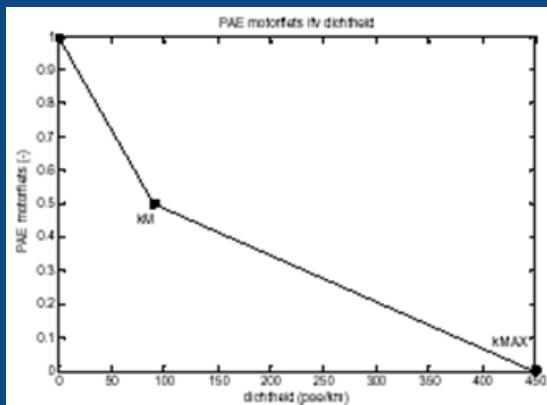

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Modal shift scenario (morning peak 2011)

#### Assumptions:

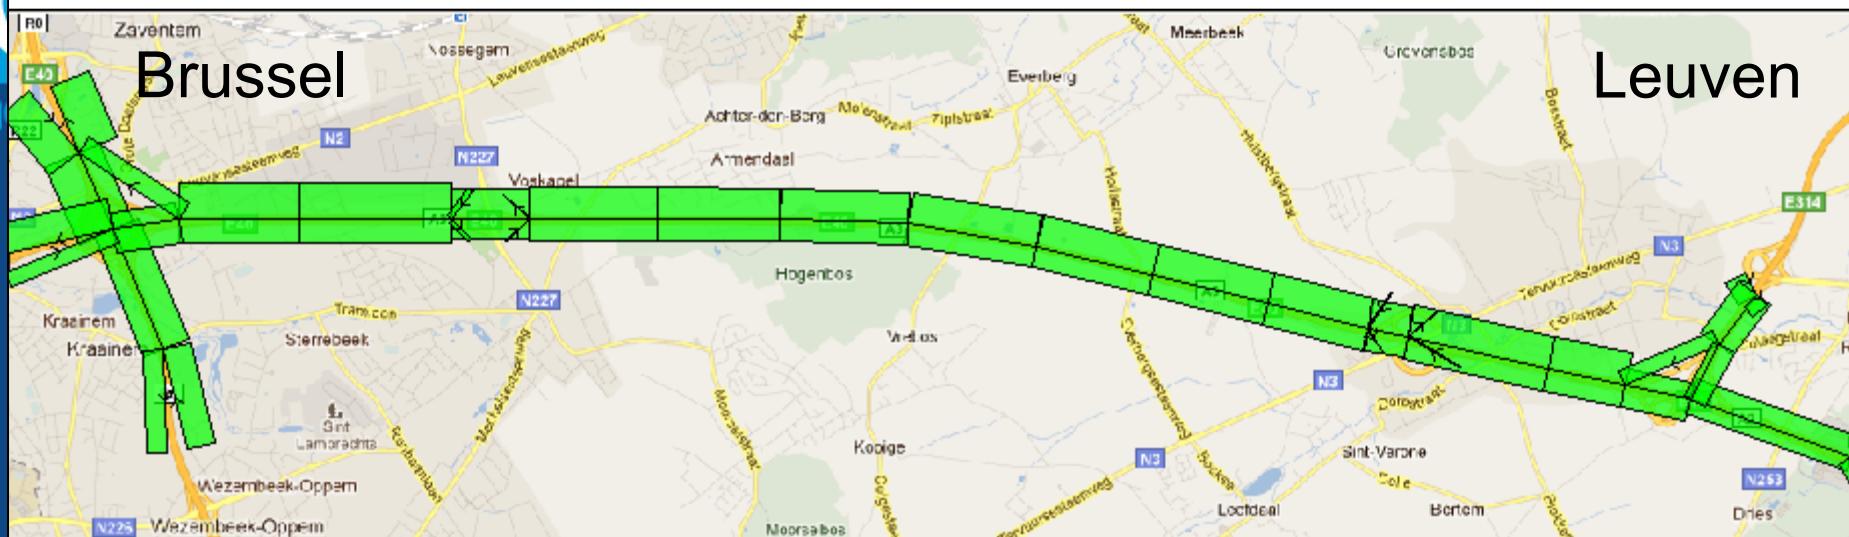

- Passenger-Car-Equivalent (PCE) motorcycle  
(How many cars would have same effect on traffic flows?)

- PCE = 1 for min. density
- PCE = 0.5 at capacity
- PCE = 0 for max. density

Referentiescenario

9u30

Scenario 10% modal shift

9u30

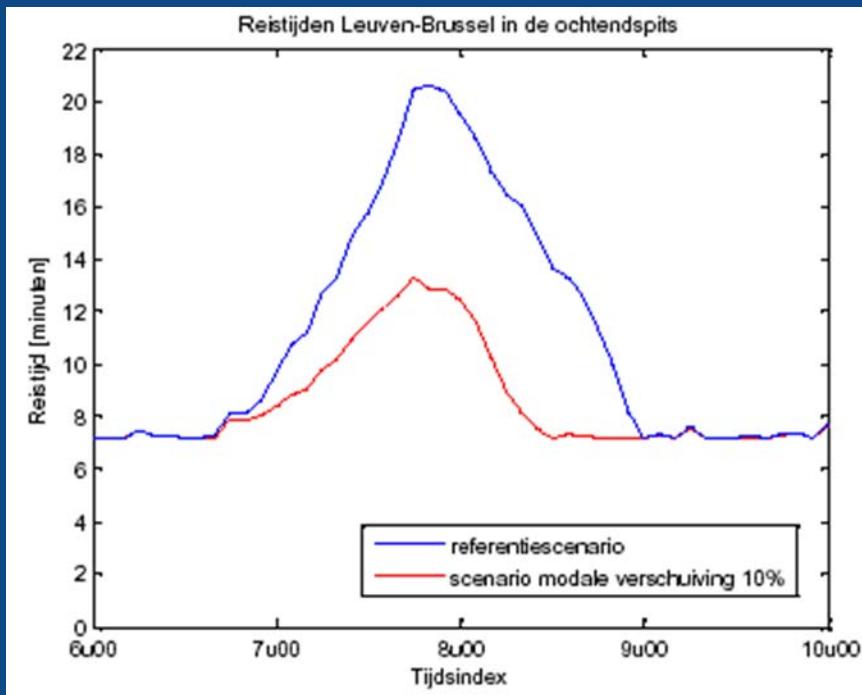

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Modal shift scenario (morning peak 2011)

#### Travel Times

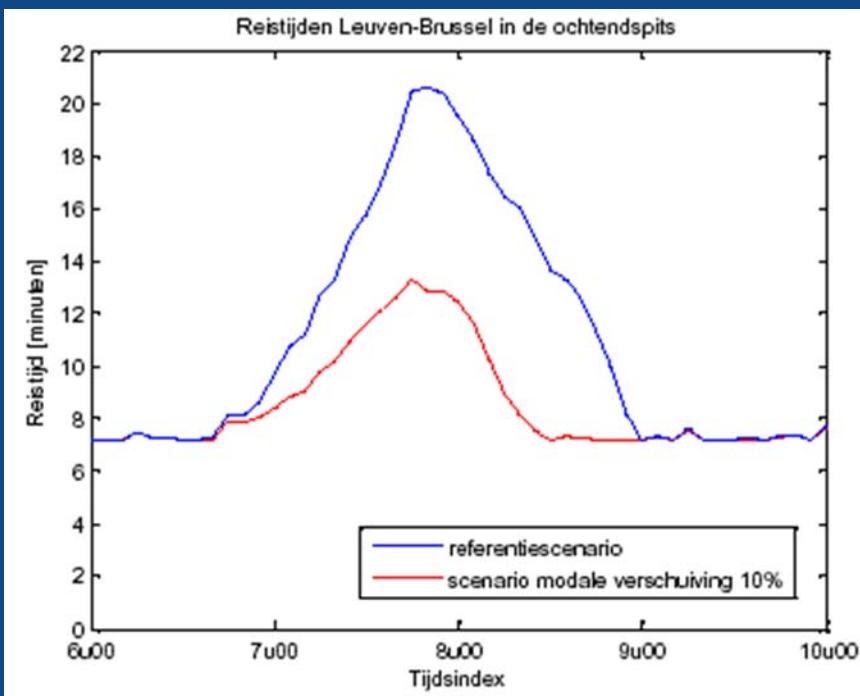

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Modal shift scenario (morning peak 2011)

#### Travel Times

Total time loss

(all vehicles Leuven-  
Brussels 6.30 – 9.30)

= 706 hours

(- 60% to reference)

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Modal shift scenario (morning peak 2011)

Total time loss

(all vehicles Leuven-Brussels 6.30 – 9.30)

taking into account newly attracted traffic  
on highway due to improved traffic conditions

= **1158 hours**

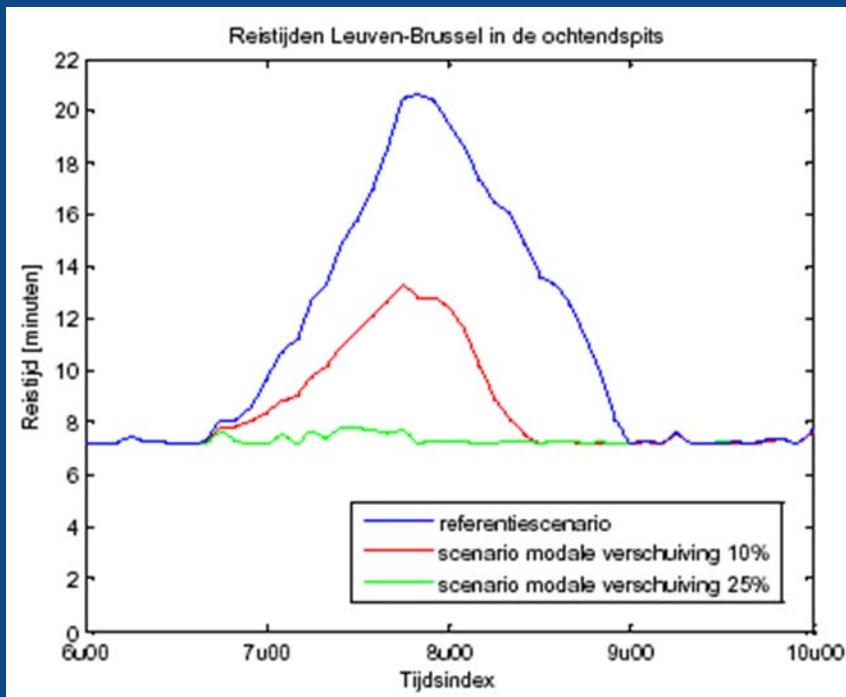

(- 40% to reference)

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Modal shift scenario (morning peak 2011)

#### Travel Times

25% modal shift  
needed to  
avoid congestion

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Global impact on traffic congestion

Extrapolate impact to Belgian highway network

Reference: **37.000 hours lost per day**

↓  
- 40% time lost in modal shift scenario

Time savings: **15.000 hours per day**

↓  
Value of time commuter 13.96 €/h

Time benefits: **210.000 € per day**

**50 Million € per year** (indicative figure)

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Global impact on traffic congestion

Impact on underlying road network:

- less (rat-run) traffic, shift to highway network
- if also modal shift on underlying road network:  
similar time benefits

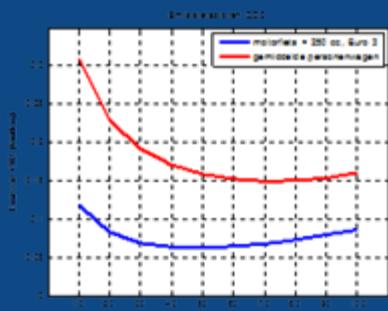

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

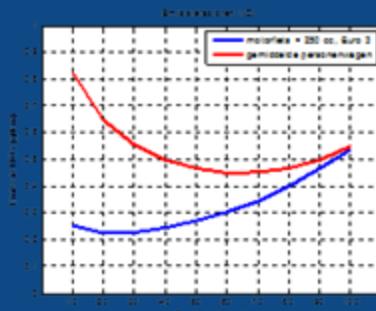

### Impact on emissions

- Emission factor ‘mean’ car (mean Belgian vehicle fleet)
- Emission factor ‘recent’ motorcycle (250cc, Euro 3)  
(source: COPERT IV emission functions 2010)

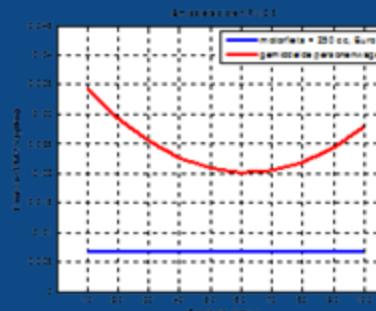

CO<sub>2</sub>

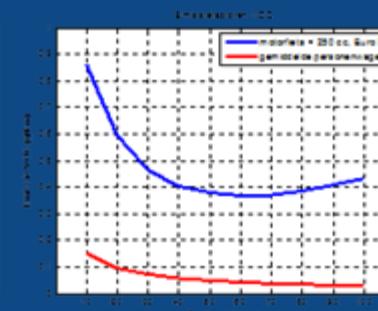

NO<sub>x</sub>

PM<sub>2.5</sub>

HC

Emissions CO<sub>2</sub>, NO<sub>x</sub>, PM<sub>2.5</sub> lower for recent motorcycles

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Impact on emissions

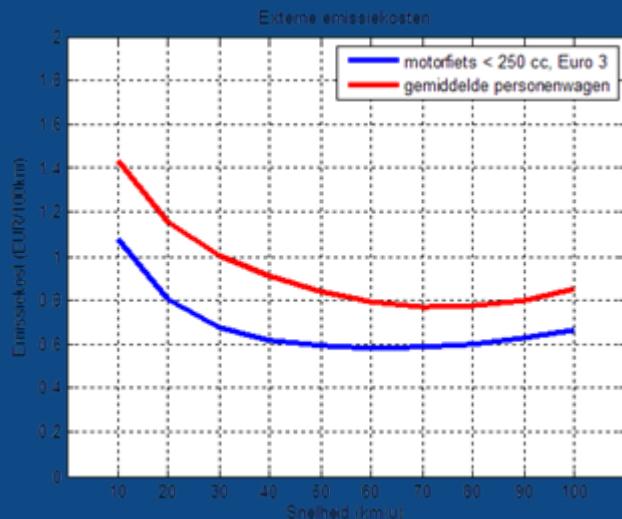

Total Emission costs (€/100 km)

(monetization based on environmental damage: NO<sub>x</sub>: 0.58 €/kg

PM<sub>2.5</sub>: 135.5 €/kg

HC: 7.5 €/kg

CO<sub>2</sub>: 20 €/ton

— ‘mean’ car

— ‘recent’ motorcycle

Emission costs **20% lower** for recent motorcycles

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

### Impact on emissions

Total Emission costs in case study Leuven-Brussels:  
(all vehicles Leuven-Brussels 6.30 – 9.30)

**6% lower** in modal shift scenario c.t. reference

- 1% due to shift in traffic composition
- 5% due to avoided traffic congestion

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised

## Conclusions

### Impact modal shift (10%) on traffic congestion:

- Queues are shorter and disappear more quickly
- Travel times are shorter
- Total time losses reduced by 40%
- Time benefits on Belgian highway network: 50 M€/year

### Impact modal shift (10%) on traffic emissions:

- Recent motorcycles emit less CO<sub>2</sub>, NO<sub>x</sub>, PM<sub>2.5</sub>, but more HC
- Total emission costs 20% lower for recent motorcycles
- Total case study emission costs 6% lower, 5% due to avoided congestion

# Innovating our mobility

## L-category vehicles: smaller, lighter, more specialised
