10 Well-Supported Reasons to Table HB 3063 & Allow All Major Vaccine Exemptions

1. Measles vaccines are now much more dangerous than measles itself [(2004-2015, CDC VAERS—108 total deaths from MMR (96) & other measles vaccines (12), while 0 children died from measles, Vaxopedia)].
2. Measles was not eliminated by vaccines! United States National Mortality statistics from 1900-1963 show that deaths from Measles plummeted from 10.0-10.5 per 100,000 (1905-1910) to 0.205 per 100,000 (1963), a 97.9% decrease before the measles vaccine was introduced in 1963.
3. In fact, measles was nearly completely eliminated by ‘public health measures’ like water purification, garbage collection, sewage systems, food inspection, better nutrition, refrigeration, central heating, food preservation, hygiene advances, & rising standards of living, not the medical intervention of vaccination.
4. Medical interventions are usually credited with 3-10% of health improvements historically. Gov. Kitzhaber’s Health Pol. Advisor Mike Benetto famously repeated medical services produce 10% of health outcomes but consume 90% of resources.
5. It was well-known that the great “Sanitation Era” from the 1850-early 1900’s wrought a major transformation of urban life from a crowded, dirty, fetid, disease-ridden state in the 1800’s to a new era of relatively minor disease concern where the great killers such as scarlet and yellow fever, measles, typhoid fever, typhus, tuberculosis, smallpox, etc. had become shadows of their former selves or eliminated by the turn of the century (1900).
6. Infectious diseases become minor aspects of national mortality figures by the 20th century and descended much further, usually over 90% in the 1900s before vaccines were introduced or widely distributed in the mid-1900s.
7. Prominent figures inc. William Osler, MD, ‘The Great Physician’, Albert Szent-Gyorgi—St. George (discoverer of Vitamin C & WWI hero for saving wounded on the battlefield and who miraculously evaded the Gestapo for years in

disguise), &
many period authors recount this time as profoundly affected by the great
“Sanitation
Era” of urban reforms, infrastructure developments, etc. that transformed
modern life.

8. The idea that people doing reading & research w/ well-referenced, scholarly,
&
scientifically-astute books, studies, and articles and who find all sorts of
fundamental problems with vaccinations, one after another—‘anti-vaxxers’—
are somehow not well-informed or being unreasonable is 100% ‘horse
puckey’
that is being spread by ‘pro-vaxxers’, many of whom do fit the bill.

9. The opposite is usually true! Pro-vaxxers commonly avoid specifics (a dead
give-away?), issue broad claims, fail to cite references, avoid scientific
studies
and make talking point presentations! This is very unreasonable &
misinformed,
unlike people going to great trouble to become educated or even expert.
Many more
scientific studies are critical of or reveal a long list of injuries, reactions,
illnesses,
convulsions, high fevers, hypoxia, NDDs—as ‘side effects’ of vaccinations.

10. Natural immunity to these normally nonfatal childhood illnesses is widely
regarded as superior to temporary or partial immunity from vaccinations
like flu & measles vaccines. An OSU researcher studying the demographics
of
flu transmission said that the immunity gained by children before they are
vaccinated is superior to that after vaccination and that vaccinating these kids
cheats them out of the chance to develop lifelong natural disease immunity.
