

There are thousands of scientists who dispute the whole notion of human-caused climate change. Climate warms and cools in cycles. Congress should NOT pass House Resolution 763 (H.R. 763), the Energy Innovation and Carbon Dividend Act and SJM 5 should not go forward. Fossil fuels are more economical currently than most of the 'favored' alternatives. President Biden was wrong to end the Keystone X Pipeline. Already, in five weeks, gas at the pump is up 35%! So, foods, clothes, etc. will also cost more very shortly. But, as to electric cars, solar energy, etc., one has to wonder why the proponents shrug off the incredible waste products both in manufacture and in disposal of batteries and other components. Note, Josephine County bought an electric bus and already ceased to use it because it cannot handle the hills and can't be recharged in outlying areas so must be towed back to town if its charge dissipates in an outlying area. As to cleaner, healthier air and environments, one also must reflect that the US leads the world in reducing pollution. Proposals in H.R. 763 will increase cost of living and reduce lifestyles. US innovation should be fostered as always. We lead the way in cleverness. We must focus on the countries doing nothing about their pollution—China being the worst. Why are they off the hook until a generation in the future? Don't forward SJM 5. It is the wrong focus. H.R. 763 will solve not
