

Senate Judiciary Hearing on Senate Bill 819

Written Testimony of Janis C. Puracal, Executive Director, Forensic Justice Project

March 30, 2021

Thank you for the opportunity to present testimony on Senate Bill 819, which establishes a procedure by which a prosecutor and an incarcerated person may jointly petition the court to vacate a conviction or reduce a sentence. I offer the following testimony in support of the bill based on my work with incarcerated individuals who are fighting wrongful conviction based on faulty and/or misleading forensic evidence.

A. Background of the Forensic Justice Project

The use of faulty and misleading forensic evidence is one of the leading causes of wrongful conviction. The Forensic Justice Project (“FJP”) is a nonprofit organization that was created in Oregon to challenge the use of faulty and misleading forensic evidence and to find helpful forensic evidence. We work at all stages of the criminal process from pre-trial through post-conviction. Our mission is to prevent wrongful convictions before they happen and correct them after they happen. To that end, we focus on getting good science into the courtroom and bad science out of the courtroom.

B. Faulty and Misleading Forensics are a Leading Cause of Wrongful Conviction

As of March 30, 2021, there had been at least 2,755 exonerations around the country, which accounts for more than 24,690 years lost in our prison system.¹ Approximately twenty four percent of those men and women were wrongly convicted in cases that involved faulty or misleading forensic evidence.²

C. Prosecutors and Defenders Can Agree that Certain Forensic Methods are Not Scientifically Valid

The National Academy of Sciences has recognized that the advent of DNA testing has led to the exoneration of hundreds of innocent people and continues to uncover a “disturbing number of wrongful convictions—some for capital crimes—and expos[e] serious

limitations in some of the forensic science approaches commonly used in the United States.”³

Independent scientists agree that certain forensic methods, like microscopic hair comparison and bite mark comparison, for example, should no longer be used.⁴ Research proves that these methods are not scientifically valid to connect a suspect to a crime scene, although an untold number of suspects were convicted on those bases. Subjective methods like these are highly susceptible to error and bias because of unfounded assumptions.⁵

The federal government has also recognized the limitations of some forensic methods. For example, on July 18, 2013, the FBI—the agency responsible for developing the method of microscopic hair comparison (*i.e.*, using a high-powered microscope to view hair from a crime scene and compare it to a known hair sample from a suspect)—publicly conceded that testimony offered for decades by its hair examiners, and those it trained, had been exaggerated and is scientifically invalid to “individualize” crime scene hairs to a particular suspect.⁶

According to the FBI, “there aren’t studies that show how many people have identical-looking hair fibers” and thus, incorrect or inflated testimony on microscopic hair analysis can mislead a judge or a jury.⁷ As one commentator put it, microscopic hair analysis “is virtually worthless as a method of identifying someone. It can only safely be used to **rule out** a suspect as the source of crime-scene materials or in combination with the vastly more accurate technique of DNA testing.”⁸

AND TECH., FORENSIC SCIENCE IN CRIMINAL COURTS: ENSURING SCIENTIFIC VALIDITY OF FEATURE-COMPARISON METHODS 47 (2016), https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/PCAST/pcast_forensic_science_report_final.pdf [hereinafter PCAST Report].

⁶ Available online at https://www.mtacdl.org/attachments/CPE/Nelson/FBI_Limits_of_Science_%20Microscopic_Hair_Comparison.pdf The FBI wrote that the only possible probative value of hair microscopy is that it may indicate, at the broad class level, that a contributor of a known sample **could** be included in a pool of people of unknown size, as a **possible** source of the hair evidence at the scene or that the contributor of a known sample could be excluded as a possible source of the hair evidence based on the known sample provided.

Independent scientists agree. In 2009, the National Academy of Sciences released a ground-breaking report (the “NAS Report”) on the state of forensics in the United States.⁹ On hair microscopy, the NAS Report “found no scientific support for the use of hair comparisons for individualization in the absence of nuclear DNA.”¹⁰ In 2016, the President’s Council of Advisors on Science and Technology under President Obama issued its own landmark report (the “PCAST Report”) in which it reviewed documents on hair microscopy from the Department of Justice and concluded that the documents “do not provide a scientific basis for concluding that microscopic hair examination is a valid and reliable process.”¹¹ The PCAST Report recognized that errors in pattern-matching methods, like hair microscopy, arise, in part, because “in certain settings, humans (1) may tend naturally to focus on similarities between samples and discount differences and (2) may also be influenced by extraneous information and external pressures about a case.”¹²

Since 2015, the FBI has been working to audit more than 3,000 cases in federal and state courts in which FBI agents provided microscopic hair analysis of crime scene evidence.¹³ Problems have been found in more than 90 percent of the cases reviewed.¹⁴ The U.S. Department of Justice has agreed not to raise procedural objections, such as statutes of limitations and procedural default claims, in response to motions for a new, fair trial in light of faulty evidence.¹⁵

The FBI also retained an independent company to conduct a full root cause analysis.¹⁶

The FBI has further written to the governors of each state to encourage the states to audit cases in which state-level examiners who were trained by the FBI offered the same scientifically invalid testimony resulting in criminal convictions.¹⁷ As of this date, FJP is unaware of any formal review of hair microscopy cases in Oregon, despite the FBI’s urging.

Others forensic methods, like bite mark comparison and conventional serology, suffer from similar problems and were the basis for an unknown number of potentially wrongful convictions in Oregon.

D. SB 819 is Essential in Some Cases Involving Faulty and Misleading Forensics

We at FJP are reviewing multiple cases that involve these now-discredited forensic methods, like hair microscopy, bite mark comparison, and conventional serology, among others. Some of our clients have been incarcerated in Oregon's prisons since the 1980s.

These are the very types of cases in which the system could benefit from SB 819. As it stands, a person convicted in Oregon on the basis of junk science may have few opportunities to get back into court to obtain relief. In many of these cases, procedural rules establish strict time bars that may have expired before state actors recognized flaws in the forensic methodology.

In addition, although Oregon has a post-conviction DNA testing statute that may open the door to a new trial,¹⁸ evidence in some cases may no longer be available for testing. Indeed, many of the hair microscopy cases originated before 2009 when Oregon first enacted a law to preserve biological evidence for DNA testing.¹⁹

Under SB 819, prosecutors can waive the time bars and jointly petition the court for relief in the interest of justice. The bill is an invaluable tool for prosecutors to be part of a system that can recognize its mistakes and make them right.

We support SB 819, and we remain available to assist the Committee. Thank you.

Sincerely,

Janis C. Puracal
