Committee: House Committee On Behavioral Health and Health Care

Measure: HB3090

Thanks to vaping, cigarette consumption by high school students fell from about 16 percent in 2011 to about 2 percent last year.

Teen vaping has been rapidly declining the last few years, despite the higher numbers that have "tried" vaping, only about just 4.2 percent of high school students and 0.4 percent of middle school students reported that they had vaped every day during the previous month. In assessing the gravity of that problem, it is crucial to estimate how many of those students would otherwise be smoking. Obviously, it is not the epidemic being pushed.

Vaping saves lives!
