Measure, Appointment or Topic: HB2738

In regards to PIR and leaded fuel emissions.

1. Have any studies been performed on the mortality rates from lead poisoning in North Portland within the two mile radius of PIR from leaded fuel emissions compared to leaded projectile emissions discharged independently within the two mile radius and NOT related to PIR?
2. Why is this proposition aimed at populations of 500,000 or larger. If leaded fuel emissions is such an issue, why haven't studies been conducted state wide near race tracks of smaller populations? Along with that study, how about conducting studies on social/economic trends near race tracks state wide.
3. Claiming that PIR leaded fuel emissions are the cause of lower educational outcomes without performing studies near PDX or any other major consumer of leaded fuels is incomplete and baseless.
