

3450- As a licensed Civil Engineer and Project Manager, energy storage (fuels and oils) that can sustain/survive earthquake forces is critical to Regional recovery. As I understand the geology of the storage areas, they sit in liquefaction zones which means they will lose foundation support during an earthquake. This will cause damage to the tanks leading to the loss of much needed fuel and leave a huge mess to clean up. This bill is so critical and important in addressing this tremendous risk. Oregonians will be much better off having carefully taken this on. (I wish it would have happened years ago but better now than never.)
