On Behalf Of:

Committee: House Committee On Climate, Energy, and Environment

Measure, Appointment or Topic: HB2038

The dis-advantages of nuclear waste need to be studied and reported on, in addition to the “advantages”. Also, sometimes any “advantage” is not an advantage at all when viewed in another context. We should be skeptical of calling any part of nuclear energy an “advantage”. The waste issue is not safe, the stuff is not natural and not safe. I know the current science says we can be “better” now than we were in years past but that doesn’t say much. There will inevitably be problems. It will pollute somewhere sometime and we just don’t need to do that. Any “advantage” of having a huge amount more power just to consume, is not really an advantage. It prolongs our consumption of everything else on the planet. Energy use and consumption has to be a balance with our environment and we don’t need to go down the path of working on nuclear energy. We need renewables, less consumption, and sustainability. Thank you.
