Committee: House Committee On Climate, Energy, and Environment

Measure, Appointment or Topic: HB3932

Beavers are an important part of keeping the water from becoming run-off. They will keep the water in the hills longer allowing it to sink in and reduce the risk and strength of wildfires. The roads and ditches and culverts are designed to get the water out of the hills as quickly as possible which is crazy in this warming climate. Lets be sensible and allow beavers to do their part and also repair logging roads so that they will help impede the flow of water giving it more time to sink in.
