Measure, Appointment or Topic:	HB3932

Based on the DEQ's current data, the primary factors for a waterway to be deemed impaired are: high water temperature, sedimentation, dissolved oxygen level, bio-criteria (health of invertebrates and shellfish) toxins (along the coast).

Scientific research and literature has shown that beaver dam complexes and floodplains help to address four of these top five factors - they are nature's solution, and they tackle these issues for free. Beavers work for us and the environment to improve water quality.
