

Submitter: Tom Hammer  
On Behalf Of: Real Science  
Committee: Senate Committee On Finance and Revenue  
Measure, Appointment or Topic: HB2081

The thought that humans have any meaningful effect on climate is erroneous. Look at the most recent 10,000 years. To the committee - do any of you know how many parts per million CO<sub>2</sub> there is in the atmosphere? Do any of you know the ideal amount of CO<sub>2</sub> the atmosphere should contain? If not, you don't know where we are and you don't know where you want to go. If you can't quantify the present and measure proposed changes, you can't manage the proposal. Furthermore, you don't know what it would cost to chase that unknown. Stop pretending that you have an understanding of climate and any ability to effect it.
